WHO ARE YOU REALLY?

Caught in the maze of Caggras syndrome

Imagine, you wake up tomorrow and recognize nobody in your closest personal environment again. Your friends? Totally unknown! The colleague with whom you have been sharing office for years? Never heard of him, relatives? Like the hell are you!

Seems such a hard fate here? In a world flooded with foreign and new combinations of services for companies. The so-called Caggras syndrome, is this extremely rare psychological phenomenon recognized these affected people

how they themselves understand, although usually it, however, it is described that they are all completely identical - making it difficult to identify them. Based on the original Caggras' great discovery - making him to die eventually. This syndrome leads to a total loss of memory, a loss of their own knowledge and their own sense of direction. It is a condition of the disease that in fact only those persons are considered to be "patients" who are completely lost in the environment. The fact also represents a clear loss of social skills for friends and relatives. The syndrome is named after the Greek philosopher Caggras (ca. 450 BC), who was the first to describe the syndrome in the 1920s.
